An AutoCAD drawing made by Tarn for Tarn Enterprises. The name AutoCAD was derived from the two most popular words used to describe the product in the late 1980s, including “automatic” and “CAD.” Other names and product slogans were suggested, including “Automatic-CAD,” “Auto-CAD,” “Auto-matic CAD,” and “CAD-Auto,” but the name AutoCAD stuck. The name AutoCAD was chosen to reflect the use of a computer in the design process. An illustration of the typical operation of AutoCAD (including plotting, command, text, and edit commands). AutoCAD was the first CAD program to have “CAD” as the name. Most other CAD programs used the term “CADR” or “CAD” as the name. In its early versions, AutoCAD also used the term “dyno-graphics” to describe its products. The first release of AutoCAD was named Release 1.

Early versions of AutoCAD allowed users to use “dyno-graphics” for drafting work. Dyno-graphics enabled users to draw in multiple layers and change the dimensions of their drawings. AutoCAD Release 1 was first released in December 1982. Initially, AutoCAD did not contain many features. After its release, the program was enhanced in several major revisions, eventually supporting most of the drafting features commonly found in other CAD programs. Features of the program's initial release are still being used today. AutoCAD also had a spreadsheet function called MicroWorkBench.

AutoCAD's successor, AutoCAD LT, is very similar to AutoCAD except that it is much smaller, lower priced, and has fewer features. AutoCAD LT was first released in October 1987. AutoCAD was the first CAD program to support external plotters. Before

AutoCAD, most CAD programs used the “z-plater” method of drawing on sheets of paper, which was much slower than using a CAD program. The first released version of AutoCAD supported the Coons & Peirce CP-1, CP-2, and CP-3 plotters, as well as the Hewlett-Packard HP-35. Coons and

AutoCAD Architecture This was one of the first products to expose the C++ ObjectARX API. AutoCAD Electrical AutoCAD Electrical was the first to integrate the ObjectARX API into the product. AutoCAD Civil 3D AutoCAD Civil 3D was the first to integrate the ObjectARX API into the product. AutoCAD Build 3D AutoCAD Build 3D is a set of file formats created specifically to support the AutoCAD Build 3D file format. They are

intended for use with the Build product line from Autodesk. The format is a 'machine-readable' representation of the CAD object, similar to DXF, but not identical. Three file formats are supported: Build 3D DWG: This is the main file format and intended to represent a DWG or DWF file that has been enhanced with 3D properties and data. Build 3D DXF: This is a derived file format. It is a 'copy' of the Build 3D DWG file (any changes are lost after conversion). Build 3D OBJ: This is a derived file format. It is a 'copy' of the Build 3D DWG file (any changes are lost after conversion). Multi-element determination of protein-metal binding using inductively coupled plasma mass spectrometry. Inductively coupled plasma mass spectrometry (ICP-MS) was used to determine the heavy metal binding capacities of (i) purified metallothionein from the common freshwater fish, (ii) whole serum proteins from humans and (iii) a liver homogenate from the Canadian redbfish (*Merlangius rhinocerus*). The identity of metal-protein adducts was confirmed using quadrupole ICP-MS in a helium carrier gas. To compare the metal-binding capacities of the three metalloproteins, a competition assay was employed, based on the progressive addition of metal-free protein to a fixed molar ratio of metal to protein. The technique relies on the ability of the

1. Field of the Invention The present invention generally relates to cable trays, and more particularly to a cable tray assembly including a cable tray structure and a swivel member.
2. Description of the Prior Art Most electrical wiring devices are often equipped with a cable assembly for the delivery of electricity to the device. A typical cable assembly includes a cable having electrical wires therein, and a rigid housing surrounding the cable for receiving the cable and for protecting the electrical wires. Such a cable assembly is often used in a house or an office. When installed, the cable is often disposed in a sloped floor near a wall or a ceiling. A typical cable assembly is often bent or curved to prevent damage to the electrical wires. To prevent the cable from being damaged due to heavy loads, the cable is often mounted on a cable tray. Conventionally, the cable tray is made of a rigid material such as metal or plastic. A typical cable tray assembly includes a cable tray that has an opening for receiving the cable assembly therein. The cable tray is then installed in the floor and the cable assembly is then fitted into the opening of the cable tray. However, when the cable assembly is fitted into the cable tray, the cable tray is often pulled and damaged by the weight of the cable assembly, thus resulting in damage to the cable assembly.
