As a basic knowledge of CAD helps one to understand the fundamental concepts used in AutoCAD, it is worthwhile to start a small basic tutorial. The following steps help to get familiar with some basic concepts, and to get started with your first drawing. If you are interested in knowing more about AutoCAD (like Professional License, Training, video tutorials etc.) it can be found on the official Autodesk website. What is CAD? While drawing has always been one of the most basic and important tasks in a student's life, learning to draw can also be a big challenge. There are a few reasons behind this. First of all, drawing is a craft that requires lots of practice and great patience. Second, everyone learns differently, and no matter what you do, no one has to learn to draw the same way. And the biggest reason, in my opinion, is that not everyone likes the same things. So it is important to understand what kind of people you are, and what do you like drawing. When choosing a CAD program for the first time, it is not only about what it can do, but also what you can do. First of all, do you have a PC, a Mac or some mobile device? While I know of Mac users who don't mind working with PCs, they have more problems with AutoCAD, and AutoCAD is not available on any mobile device, at least at the time of writing. The first thing you need is a digital camera, and if you have a professional level camera, you should get a flatbed scanner. They are the most suitable for professional document scanning and CAD. You may use your iPad or iPhone as a digital camera, but the resolution is quite low. I would suggest you to get a Canon ScanSnap scanner, for a good price. However, there are other scanners available with higher resolutions. A scanner that I would not recommend is the Samsung SCX-2700, as it lacks some basic features, like page centering and automatic document feeder. (See the full review of the Canon ScanSnap on my review page.) Another equipment that you might need is a graphic tablet. While a mouse and a keyboard are pretty enough for beginners, they are less precise than a graphic tablet. They are also less suitable for precision drawing, as a mouse is a flat input device. A mouse has some tension, and if you draw a line with a mouse

The format was initially used to exchange data between the various Autodesk CAD programs. The AIF format is one of the most used interchange formats among all other CAD programs. It is available in a generic version (like DXF) and several versions with object-specific extensions, for example for wall objects: The XDDF (XD Drawing Data Format) was a proprietary object file format for AutoCAD; it was superseded by the DWG format. There are now open-source CAD format encoders and decoders, namely ACU (Autodesk Codeware Universal), ABCI (Autodesk Bydex Binary Content Interface) and DCI (Direct to CIM Converter). The AIF format is ASCII text, and is often "tagged" to describe features. The a1d647c40b
